REVIEW ARTICLE

Tooth-Bleaching: A Review of the Efficacy and Adverse Effects of Various Tooth Whitening Products

Abdul Majeed¹, Imran Farooq², Siyas R. Grobler³ and RJ Rossouw⁴

ABSTRACT

Tooth bleaching (whitening) is one of the most common and inexpensive method for treating discoloration of teeth. Dental aesthetics, especially tooth colour, is of great importance to majority of the people and discoloration of even a single tooth can negatively influence the quality of life. Therefore, a review of the literature was carried out (limited to aesthetic tooth bleaching) to provide a broad overview of the efficacy and adverse effects of various tooth whitening products on soft and hard oral tissues.

Key Words: Tooth bleaching, Whitening, Peroxide, Discoloration.

INTRODUCTION

Dental aesthetics, including tooth colour, is of great importance for majority of the people and any discoloration or staining can impact their quality of life negatively. The colour of teeth reflects a combination of its intrinsic colour and the presence of extrinsic stains due to various factors such as smoking, intake of tannin-rich foods and drinks (e.g. red wine), and the use of chlorhexidine or metal salts such as tin and iron.¹⁻³ A number of methods can be used to remove staining like professional cleaning and polishing, whitening tooth-pastes, internal bleaching of non-vital teeth, external bleaching of vital teeth, and micro-abrasion of enamel. Severe stains can be covered with crowns or veneers, but this is a more invasive and costly option.^{4,5}

The increasing demand for a better appearance and whiter smile, has made vital tooth-bleaching (also referred to as tooth-whitening) a popular dental procedure. It has developed into one of the fastest growing areas of aesthetic dentistry. It provides a more conservative treatment approach for discoloured teeth as compared to other restorative treatment modalities such as composite fillings, veneers or crowns.¹ Commonly used methods for tooth-whitening include in-office or power bleaching,⁶ dentist-supervised home bleaching or nightguard vital bleaching,⁷ and easily available over-the-counter (OTC) whitening products for self-application.

METHODOLOGY

This literature review was limited to aesthetic tooth-bleaching and aimed to provide a broad overview of bleaching techniques, their efficacy, and adverse effects on soft and hard tissues as well as the management of tooth sensitivity and gingival irritation. In formulating this review, only English-language articles available electronically were selected. The PubMed database and Google scholar search engine were explored with keywords which included: tooth-whitening, tooth-bleaching, carbamide peroxide, hydrogen peroxide, bleaching and dentistry, home-bleaching, and vital bleaching. Over 200 articles were initially reviewed and 82 articles were shortlisted on the basis of their applicability to the present topic of review and then studied in detail.

Efficacy of different types of tooth-whitening products: Nightguard vital bleaching using 10% CP is the most widely used and extensively researched tooth-bleaching technique. The American Dental Association has awarded its seal of acceptance to a number of dentist-supervised home bleaching products containing 10% CP.⁸ Nightguard vital bleaching techniques have been effective for bleaching teeth stained by aging, mild fluorosis, trauma, inherent discoloration and tetracycline.^{9,10} According to the American Dental Association guidelines for the acceptance of peroxide-containing oral hygiene products, the clinical efficacy may be demonstrated by a change of two value oriented shade increments and a perceptible colour must be maintained in 50% of the recall population at 6 months compared to the control, to reflect the duration of efficacy.¹¹ In a long-term clinical trial, Leonard et al.¹² reported whitening of teeth in 98% of the participants by 10% CP and 82% of the participants retained the whitening effect upto 47 months post-treatment. A meta-analysis of the clinical trials from 1980-1999 on dentist-supervised home bleaching products using 10% CP

4. Ajeng Meidy Yuma Pratiwi

The screenshot shows a Zoom meeting interface. The main window displays a presentation slide with the title "Antibiotik topikal pada endodontik" (Topical Antibiotics in Endodontics). The slide features a diagram of a tooth with a root canal, showing a red irrigant being applied to the root tip. Below the diagram, the text reads: "Tidak ada bukti ilmiah yang mendukung penggunaan antibiotik topikal dalam *pulp capping* atau sterilisasi saluran akar. Selain itu, mikroorganisme yang diisolasi dari saluran akar resisten terhadap tetrasiklin dan penggunaannya dapat meningkatkan pertumbuhan bakteri. Penggunaan antibiotik topikal juga menyebabkan perubahan warna gigi bila digunakan sebagai obat topikal." (There is no scientific evidence supporting the use of topical antibiotics in *pulp capping* or root canal sterilization. In addition, microorganisms isolated from root canals are resistant to tetracycline and their use can increase bacterial growth. The use of topical antibiotics also causes tooth discoloration when used as a topical drug.)

On the right side of the screen, there is a vertical stack of four video thumbnails showing participants: Rina Permatasari, Anggraini Chandrani..., Chantikamd, and Ajeng Meidy Yuma Pratiwi. The Zoom interface includes a top bar with "Turn on Original Sound" and "You are viewing Ajeng Meidy's screen", a bottom bar with "Participants", "Chat", "Share Screen", "Record", and "Reactions", and a "Leave Meeting" button in the bottom right corner.

Diambil dari: Journal Effect of Composite Polymerization Stress and Placement Technique on Dentin Micropermeability of Class I Restoration

Effect of Composite Polymerization Stress and Placement Technique on Dentin Micropermeability of Class I Restorations

Drana Maria Feresch / Gabriel Flores Abrach / Roberto Ruggiero Dinger / Erickson Allen Huggenberg / Marcelo Casanova

Purpose: To investigate the effect of polymerization stress and insertion technique on dentin micropermeability of composites placed under pulpal pressure.

Materials and Methods: One high-intensity conventional (HC) Filtek Supreme Ultra; 3M Craft; one low-intensity conventional (LC) Filtek Supreme Ultra Flowable; 3M Craft; one high-intensity bulk fill (BF) Filtek Bulk Fill Flowable; 3M Craft; and one low-intensity bulk fill (LF) Filtek Bulk Fill Flowable; 3M Craft composites were evaluated. Polymerization stress was measured with materials bonded to acrylic rods in a universal testing machine (n = 5). Class I preparations were made in extracted molars, in which tooth roots were removed and the pulpal chambers cleaned. Preparations were coupled to a hydraulic device to simulate pulpal pressure during composite placement (n = 5). Conventional composites were placed in two horizontal increments, while bulk fill materials were placed in one, single increment. Fluid flow rate (µl/min) and dentin micropermeability (N) were monitored. The restoration interface was observed under confocal laser scanning microscopy.

Results: LC and LF presented statistically significant higher polymerization stress than HC and HF. Fluid flow rate and dentin micropermeability did not differ among the groups. However, different patterns of fluid infiltration and restoration integrity were observed. HF and LF presented well-sealed surrounding margins with small gaps along the pulpal wall, while HF demonstrated more cracks in the adhesive layer. LC and LF restorations had larger gaps along all bonded interfaces.

Conclusion: No differences in polymerization stress was found when conventional and bulk fill composites with similar viscosities were compared. Neither polymerization stress or placement technique demonstrated a significant effect on dentin micropermeability. The incremental placement technique using a conventional, high-intensity composite exhibited qualitatively better marginal integrity.

Keywords: composites, bulk-fill composites, incremental layering technique, shrinkage stress, dentin permeability, hybrid layer, adhesion.
